

Introduction

This paper argues that state capacity in post-conflict settings depends more on infrastructural reach than on coercive force alone. The remainder of the paper develops this thesis across a survey of comparative cases.

The scope of the argument is comparative, drawing on cases from the post-conflict statebuilding literature.

Comparative Cases

Case material discussed here is illustrative only and is not itself part of the envelope this fixture exercises; the structural-envelope pass reads the introduction and conclusion, not this body section.

Conclusion

In sum, infrastructural power better explains durable post-conflict order than coercive capacity alone, restating the paper's stated thesis in light of the cases surveyed.
